Cybersecurity student - Linux, networking, threat detection

Computer Engineering student (Year IV, Semester VII) working toward a security analyst internship. Networking foundation from self-studied Cisco CCNA material and college network courses: TCP/IP, DNS, DHCP, ports and protocols. Hands-on on both sides of the fence - Linux permissions, users and processes, Windows fundamentals, packet capture in Wireshark, and TryHackMe labs on Linux, Windows and Active Directory. I document every lab in my learning journal, because I would rather show the work than claim it.

Technical skills

Networking - TCP/IP and the OSI model, DNS, DHCP, subnetting, common ports and protocols, routing and switching fundamentals, Wireshark packet analysis (TCP three-way handshake, DNS resolution)

Systems - Linux command line: file permissions, users and groups, sudo, special permission bits, processes; Windows fundamentals: NTFS permissions, UAC, Registry Editor, Task Manager, BitLocker, Windows Firewall, Volume Shadow Copy

Security - CIA triad and security frameworks, common attack types, threat landscape, security risk management basics, Active Directory basics (domains, Group Policy, authentication, trusts); Nmap host discovery and port enumeration; Kali Linux toolset at an introductory level

Scripting and data - Python, Bash basics, SQL, PostgreSQL, MySQL

Other - HTML, CSS, JavaScript, Git and GitHub, LaTeX

Education

Bachelor of Engineering (B.E.), Computer Engineering - Khwopa Engineering College, Purbanchal University

2021 - 2027 (expected) | currently Year IV, Semester VII

Relevant coursework: Computer Networks, Operating Systems, Data Structures and Algorithms, Database Management Systems

Higher Secondary Education (+2), Science - National School of Sciences, Lainchaur

Hands-on work

Networking and Security Learning Journal - github.com/Codingincloud/networking-security-learning-journey

Eleven documented lab days so far, each written up with the commands run, what the output meant, and what went wrong. Covers TCP/IP and first packet captures, IP and MAC addressing, Linux file operations and permissions, user and group management with sudo, special permission bits, and process management; Wireshark captures with notes tied to the CCNA material. Rebuilt as a version-controlled repository with a table of contents and a consistent lab template rather than scattered notes.

TryHackMe - practical labs

Completed Linux Fundamentals Part 1, Windows Fundamentals 1, 2 and 3, and Active Directory Basics. Working through Linux Fundamentals Parts 2 and 3, Nmap and Wireshark rooms next.

Home lab: segmented attack and defence network (*in progress*)

Kali Linux and a Metasploitable/Windows evaluation VM on an isolated host-only network, built to practise host discovery, service enumeration and traffic analysis without touching any network I do not own. Each exercise is written up with the attack and the detection for it.

Blood Donor Information Management System - college group project

Web-based system to manage donors, blood groups and blood requests: donor registration, search and filtering by blood group, record updates and request handling. Designed the relational schema, then added input validation, authentication and CRUD operations. Python, Streamlit, PostgreSQL, SQL.

Watch E-Commerce Website - college project

Responsive storefront built in WordPress: product listings, categories, navigation and layout customisation. WordPress, HTML, CSS.

Certifications and training

- **Cisco CCNA** - curriculum self-studied; certification exam not yet taken
- **CompTIA Security+ (SY0-701)** - study plan in progress (Professor Messer course)
- **TryHackMe** - self-paced labs, ongoing
